Introduction

This document details each Microsoft Copilot in Intune capability currently available, provide background on its intended use and offer guidance on how to use each feature.

The examples and screenshots provided are for your reference. Apply the examples to devices, policies and apps that are in your tenant, using the steps and screenshots for guidance. Running all examples in this guide will consume approximately 8–10 SCUs.

If you have any questions or feedback, please reach out to: copilotintune@microsoft.com. This document was last updated in June 2026.

Alternate access
Copilot Chat will be the primary means of accessing Copilot in Intune capabilities in this document, however most capabilities have alternate ways to access them. If there is an alternate access method, it will be specified at the start of the section.
Additional suggested scenarios
Additional supplementary scenarios that you can attempt will be added to each section, where applicable. These scenarios are optional and meant to showcase alternate uses or capabilities of the feature.

Prerequisites

Ensure Security Copilot is enabled and Copilot in Intune capabilities are visible in your tenant.

Enabling Copilot in Intune in Your Tenant

To enable Microsoft Copilot in Intune, you will need to perform configuration through the Microsoft Security Copilot portal and additionally ensure that the Intune plug-in is enabled.

Follow the documentation to provision capacity for Security Copilot: [Get started with Microsoft Security Copilot | Microsoft Learn](#).

Then, configure Security Copilot and Microsoft Intune by following this documentation: [Security Copilot in Microsoft Intune | Microsoft Learn](#).

Security Copilot Agents in Intune

Security Copilot agents in Intune are AI-powered assistants that enhance enterprise security. They automate tasks for endpoint protection, identity management, threat intelligence, and device configuration. They help IT teams quickly address vulnerabilities, policy gaps, and emerging threats.

Agents are built on Microsoft Security Copilot's generative AI and automation capabilities. They observe, reason, and act with oversight and review from your administrators. Each agent is tailored to a specific use case, operates within the Intune admin center, and leverages role-based access controls.

The agents listed below are available within Intune and offer the corresponding functionalities:

- Change Review Agent (public preview)
 - Evaluates the effect of [Multi Admin Approval](#) (MAA) requests for PowerShell Scripts on Windows devices in Intune and makes recommendations for the actions you can take.
- Policy Configuration Agent (public preview)
 - Uses provided documents or instructions to find matching settings in the Intune settings catalog and recommends values for these settings. You can then use the agent to create a policy with those settings and their values.
- Vulnerability Remediation Agent (public preview)
 - Uses Defender data to monitor vulnerabilities and prioritize remediation with AI-driven risk assessments.

Each agent has specific prerequisites and setup steps required, based on the scope of actions that it needs to take to perform actions in your Intune tenant:

- [Get Started with the Change Review Agent | Microsoft Learn](#)
- [Learn about Policy Configuration Agent and set it up | Microsoft Learn](#)
- [Vulnerability Remediation Agent Overview and Set Up | Microsoft Learn](#)

Steps	Screenshot
In the Intune admin console, navigate to Agents blade to view all available agents on the Security Copilot agents page.	 The screenshot shows the Microsoft Intune admin center interface. On the left is a navigation pane with various options: Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Agents (highlighted with a red circle and the number 1), Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main content area is titled 'Security Copilot agents' and includes a sub-header 'Explore Security Copilot agents that use generative AI and your security tools to perform critical tasks autonomously.' Below this, there are three agent cards: 'Change Review Agent' (Microsoft), 'Policy Configuration Agent' (Microsoft), and 'Vulnerability Remediation Agent' (Microsoft). Each card has a 'View details' button. At the bottom, there is a section titled 'More agents coming soon' with a graphic of a robot and text stating: 'We're building more Security Copilot agents that use AI to complete routine tasks and surface insights. Keep checking this page.'

Policy Configuration Agent

Traditionally, IT administrators have been responsible for manually configuring settings to align with organizational requirements. These configurations are often driven by the need to enforce security standards, maintain compliance, or optimize the user experience for productivity.

The Policy Configuration Agent interprets natural language and attempts to map these instructions to Intune settings.

The Agent can optionally take this a step further if provided with additional context, known as a *knowledge source*. For example, if your organization must adhere to a security baseline that is frequently updated due to industry regulations, you can provide the updated baseline document to the agent. It will then suggest the appropriate settings and values for your review. An IT admin can then create a new policy with those settings and assign it to the required devices.

Prerequisites

- Please ensure you meet all the prerequisites mentioned here [Learn about Policy Configuration Agent and set it up - Microsoft Intune | Microsoft Learn](#)

Invoking the Policy Configuration Agent requires you to provide *instructions* and optionally a *knowledge source*:

- *Instructions* are used to direct the agent what settings and values it should suggest
- A *knowledge source* provides additional context and information that the agent can use and reference when carrying out your *instructions*.
 - *Knowledge sources* can optionally be uploaded and saved, enabling future instructions to reference the same knowledge source. [Here](#) are the instructions to add, save and View a knowledge source that you can use after you have completed the below exercise.

Additional suggested scenarios
If you have your own design document, a security baseline or any other configuration requirements documentation, you could opt to use that in addition to using the requirements that we suggest in this guide to make this example more relevant to you and your organization.

Steps	Screenshot
Copy the Organizational Security requirements to Notepad and save it as a .txt file.	Organizational Security Requirements: - All Windows devices must be encrypted - All Windows devices must have their entire hard drives encrypted - All Windows devices must be encrypted with the strongest possible encryption method possible - All Windows devices must have their encryption keys escrowed to Entra ID - Remote Desktop must not be enabled - Windows Firewall must be enabled for all profiles
In the Intune admin console , navigate to Agents to view all available agents on the Security Copilot agents page. Below the Policy Configuration Agent , click on View details .	
If the agent has not been setup, you should set it up now, by clicking on the 'Set up Agent' button. If the agent is already setup, then you can skip the setup instructions.	

Continue the setup and click on Setup Agent to finish the setup

Click on **Create** new and select **Policy draft**.

Provide the required information when creating a new policy draft using the agent. Note that you can use natural language (NL) to provide a description of the policy that you would like to create. You can provide a file describing the device configuration requirements in NL. They can be internal policy documents and baselines, like security and compliance policies and frameworks, industry standards that describe settings, or risk assessment guidelines for device configurations. Use the previously saved text file. Only .txt files are supported in the current release; more file formats will be added in future. To upload the text file click on “add a document.”

Once the file is uploaded click on create

The screenshot shows the Microsoft Intune admin center interface. On the left is a navigation pane with options like Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Agents, Users, Reports, Groups, Tenant administration, and Troubleshooting + support. The main area displays the 'Policy Configuration Agent (Preview)' page. On the right, a 'Create new policy draft' window is open. It has fields for 'Policy name' (Organization Windows Security Requirements), 'Description' (A draft policy to demonstrate the mapping of natural language requirements to Intune settings and values), and 'Knowledge source' (Select a knowledge source...). Below these is an 'Instructions' section with a text area containing 'Create a policy that aligns to my organizations security requirements.' and a '+ add a document' button. A red box highlights the 'Uploaded Document' section, which shows 'Windows Security Requirements.txt' with a 'Remove' button. Below this is an 'Ideas to get you started' section with three bullet points. At the bottom right, a red arrow points to the 'Create' button.

Agent will run and start showing suggestions, once run is complete.

The screenshot shows the Microsoft Intune admin center interface. On the left is a navigation pane with options like Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Agents, Users, Reports, Groups, Tenant administration, and Troubleshooting + support. The main area displays the 'Policy Configuration Agent (Preview)' page. On the right, a 'Notifications' window is open. It shows 'More events in the activity log' and a 'Dismiss all' button. Below this is a notification titled 'Agent is running' with a 'View Agent' button. A red box highlights the 'View Agent' button, and a red arrow points to it. The main area also shows 'Agent suggestions' and 'Activity' sections.

You can view the agent run progress under activity. If this does not appear, click on the Refresh button and check again.

The screenshot shows the Microsoft Intune admin center interface. On the left is a navigation pane with options like Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Agents, Users, Reports, Groups, Tenant administration, and Troubleshooting + support. The main area displays the 'Policy Configuration Agent (Preview)' page. On the right, a 'Notifications' window is open. It shows 'More events in the activity log' and a 'Dismiss all' button. Below this is a notification titled 'Agent is running' with a 'View Agent' button. A red box highlights the 'View Agent' button, and a red arrow points to it. The main area also shows 'Agent suggestions' and 'Activity' sections.

	
Let's review one of the suggestions generated by the agent. Click on the recently generated suggestion.	
Review the content under suggested Action. The Agent provides summarized, actionable	

information for the admins.

Scroll down on the page to see further information on the settings that the agent found and matched. Click on Create configuration policy to start creating the policy.

Review the policy settings and continue with the workflow.

You can click on create to finish policy creation.

To help ensure that other admins on the team can keep track of the actions taken against a suggestion, you can click on “Manage Suggestion” and select an appropriate status, click on Add to save it.

The screenshot shows the Microsoft Intune admin center interface. The left sidebar contains navigation links: Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Agents, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main content area is titled 'Review and create Organization Windows Security Requirements'. It features a 'Manage suggestion' link (1) and a 'Manage suggestion' dropdown menu (2) with a 'Completed' status. The main content area displays an 'AI Summary' section with details about the suggestion, including 'Status: success', 'Problem', 'Approach', 'Result', 'Next Steps', and 'Insights'. At the bottom, there is a 'Policy details' section and a 'Create configuration policy' button. A 'Save' button (3) is located at the bottom right of the page.

Change Review Agent

The Change Review Agent evaluates [Multi Admin Approval](#) requests for PowerShell scripts on Windows devices and provides risk-based recommendations with contextual insights. These insights help administrators understand script behavior and associated risks, so they can decide whether to approve or deny requests more quickly.

Prerequisites:

- Please ensure you meet all the prerequisites mentioned here [Change Review Agent Overview - Microsoft Intune | Microsoft Learn](#)
- Ensure Multi Admin Approval (MAA) is *enabled for scripts* [Use Multi Admin Approval in Intune - Microsoft Intune | Microsoft Learn](#) and you have
- At least one Windows script is awaiting approval, guidance for uploading script is here [Add PowerShell Scripts to Windows Devices in Microsoft Intune - Microsoft Intune | Microsoft Learn](#) .

Steps	Screenshot
-------	------------

In the Intune admin console, navigate to **Agents** to view all available agents on the Security Copilot agents page.

Below the **Change Review Agent**, click on **View details**.

If the agent has not been setup, you should set it up now, by clicking on the ‘Set up Agent’ button. If the agent is already setup, then you can skip the setup instructions.

Click on the Start Agent button; this will complete the agent's setup.

Agent will run for the first time, if there are Windows Platform scripts that are pending approval via MAA, they will start to show up under Agent suggestions

Vulnerability Remediation Agent

The Vulnerability Remediation Agent uses AI-powered analysis to identify and prioritize vulnerabilities across your managed devices, providing step-by-step remediation guidance through the Intune admin center.

Prerequisites:

Please ensure you meet all the prerequisites mentioned here [Vulnerability Remediation Agent Overview and Set Up - Microsoft Intune | Microsoft Learn](#)

Steps	Screenshot
In the Intune admin console, navigate to Agents to view all available agents on the Security Copilot agents page. Below the Vulnerability Remediation Agent, click on View details.	 The screenshot shows the Microsoft Intune admin center interface. On the left is a navigation pane with options: Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Agents, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main content area is titled 'Security Copilot agents' and includes a sub-header 'Explore Security Copilot agents that use generative AI and your security tools to perform critical tasks autonomously.' Below this are three agent cards: 'Change Review Agent', 'Policy Configuration Agent', and 'Vulnerability Remediation Agent'. Each card has a 'View details' button. A red arrow points to the 'Vulnerability Remediation Agent' card, which is also marked with a red circle containing the number '1'. Below the agent cards, there is a section titled 'More agents coming soon' with a graphic of a box and arrows, and a message: 'We're building more Security Copilot agents that use AI to complete routine tasks and surface insights. Keep checking this page.'

If the agent has not been setup, you should set it up now, by clicking on the 'Set up Agent' button. If the agent is already set up, then you can skip the setup instructions.

The screenshot displays the Microsoft Intune admin center interface. The top navigation bar includes the 'Microsoft Intune admin center' title, a 'Copilot' button, and various system icons. The left sidebar lists navigation options: Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Agents, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main content area is titled 'Vulnerability Remediation Agent (Preview)' and includes a 'Home' breadcrumb. Below the title are buttons for 'Run', 'Refresh', and 'Remove Agent'. The page is updated as of 6/4/2026, 7:42:15 AM. The 'Overview' tab is selected, showing a message: 'This Security Copilot agent is available. Here's what you can do next:'. A large blue plus icon is centered. Below it, text explains that the agent is in preview and doesn't take action on devices. A 'Set up agent' button is prominently displayed at the bottom, with a red arrow pointing to it. A link to 'Learn more about agents' is also present.

On the setup page, click on the Set up agent button; this will complete the agent's setup. To continue, you will need to grant the Agentic user the required permissions.

In the resulting suggested action page, details of the vulnerability/CVE will be shown including the assessed severity of the exploit (and if a public exploit or proof of concept has been released).

Links to Microsoft Defender for Endpoint are also provided.

Suggested action

Vulnerability Remediation Agent

Update microsoft Edge Chromium-based to version 143.0.3650.66 or higher due to detected vulnerabilities.Check the "actions to take" section below for available updates, or create a new Intune application to do the update. ⁽¹⁾

Factors

Multiple vulnerabilities in Chromium-based Microsoft Edge, including type confusion and out-of-bounds write in the V8 JavaScript engine and WebGPU, could allow remote attackers to execute arbitrary code or escalate privileges by persuading users to visit crafted HTML pages. Some vulnerabilities are known to be exploited in the wild and are rated as high severity. Remediation is to apply the latest vendor patches. Prompt patching is recommended due to the risk of remote code execution and known exploits. CVE-2025-13223, CVE-2025-12725, CVE-2025-13224, CVE-2025-12726, CVE-2025-13042 are used for analysis based on their highest CVSS score. An exploit is publicly available for these CVEs: CVE-2025-13223

Actions to take

An application to use for the requested action was not found as an existing app in Intune. You'll need to create a new application in Intune and configure it to update the application. This might require additional research into what application type, package, and version to use. Check application store app types in Intune for an app to use for the update, as that will save on packaging and configuration details. For more detailed steps depending on the application type, refer to Intune documentation.
To create an application to update the affected applications:

1. Select the export to CSV link to download a CSV file that contains the list of devices to remediate.

2. In the Entra console

- Navigate to Groups > All Groups.
- Create or select an Existing group, and then select Members
- Using the Import member option in the Bulk operations action, upload the CSV file from step 1 above and submit the changes.

3. In the Intune console

- Navigate to Apps > All apps.
- Create and configure a new application to do the update.
- Add the Group updated in step 2 above to the Required assignment, and then save the changes.

Admins should navigate to Apps > Monitor > App install status to view deployment progress and troubleshoot failed installations. Confirm previous versions have been uninstalled on all devices.

Configurations

There are no recommended settings catalog policy configurations for these vulnerabilities. [Learn more about agent suggested policy configurations](#)

Copilot Chat

Copilot Chat offers IT admins easy access to Copilot, available at the top of the Intune admin console. Dynamic suggestions are displayed as users type into the Copilot Chat prompt box, matching the entered query with available prompts that are built into Intune. Prompt history and context is retained within a chat session, so previous interactions remain visible which reduces the need to repeat queries as you navigate around the Intune admin console.

Dynamic prompt suggestions are broken down into three sections: *Suggestions*, *Explore your data*, and *Check documentation*. Selecting any of the prompt suggestions will execute the prompt in the Copilot Chat window.

Reference documentation: [Security Copilot in Intune features overview - Microsoft Intune | Microsoft Learn](#).

Let's walk through the experience.

Steps	Screenshot
Click on the Copilot button at the top of the Intune admin console.	

Type a question into the Copilot Chat prompt box to see suggested prompts for each of the three sections: *Suggestions*, *Explore your data* and *Check documentation*.

The image displays three sequential screenshots of the Microsoft Copilot interface, illustrating the workflow from a user's question to the final Copilot response.

Screenshot 1: The Copilot interface shows the prompt "What would you like to know?" and a sub-header "Get info about devices, policies, users, and much more. Just type your question to get prompts to choose from. You can also [explore your Intune data](#) and easily take action." A blue box with the text "Enter your question into the Copilot Chat prompt box" has an arrow pointing to the input field at the bottom.

Screenshot 2: The interface shows the same prompt, but now a list of suggestions is displayed. A green box with the text "Suggestions are shown based on the entered question" has an arrow pointing to the suggestions list. The suggestions are categorized into three sections: "Suggestions" (Compare two Intune devices, Summarize an Intune device, What is the impact of one of my Intune policies on end-users?), "Explore your data" (Get the quality update with the highest OS version), and "Check documentation" (What Operating Systems does Intune support?).

Screenshot 3: The interface shows the same prompt, but now the selected prompt "What Operating Systems does Intune support?" is highlighted in a yellow box. A green box with the text "The selected prompt will execute in the Copilot Chat window" has an arrow pointing to the highlighted prompt. The Copilot response is displayed below the prompt, showing the generated content and a list of references.

Copilot Response: The response to the question "What Operating Systems does Intune support?" is as follows:

Microsoft Intune supports management of the following operating systems: iOS/iPadOS, Android (including Samsung Knox), Windows 10 and Windows 11, macOS, and Linux. Each platform has specific requirements and supported versions, so it's important to check the documentation for details on version compatibility and feature availability ¹ ² ³. This summary covers all major device types currently referenced in Microsoft documentation.

References:

- 2 Troubleshooting data transfer between apps
- 3 Device protection in Microsoft 365 Business Premium

Close the Copilot Chat window by again selecting the Copilot button at the top of the Intune admin console or click on the X option in the copilot chat pane.

Navigate to any other blade in the Intune admin console and again click on the Copilot Chat button.

Notice that chat history is retained.

The screenshot displays the Microsoft Intune admin center interface. On the left, a navigation pane lists various sections: Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main area is titled 'Devices | Overview' and includes a search bar, a refresh button, and a 'Manage devices by platform' section. This section shows counts for Windows (76 devices), macOS (10 devices), Linux (8 devices), and Android (3 devices). Below this, there's a section for 'Autopatch Groups Membership' with counts for 'Devices ready' (29), 'Devices not ready' (14), and 'Devices not registered' (110). At the bottom, a 'Configuration policy assignment failures' section shows 'Profiles with error or conflict' (11). On the right side, a 'Copilot' chat window is open, featuring a 'What would you like to know?' prompt and a list of suggested topics: 'Overview of Basic Mobility and Security in Microsoft 365 for business', 'Troubleshooting data transfer between apps', and 'Device protection in Microsoft 365 Business Premium'. A blue callout box with an arrow points to the 'Copilot' button in the top right corner of the Intune admin center, with the text 'Select the Copilot button to show Copilot Chat with history'.

Click the 3 dots '...' on the Copilot Chat window to view available actions, and select **New chat** to remove chat history and start a new Copilot Chat.

The screenshot shows the Microsoft Intune admin center interface. On the right, the Copilot chat window is open, displaying a list of actions: 'New chat', 'Learn more', 'Security Copilot', 'Privacy statement', and 'Give feedback'. A blue callout box points to the three-dot menu icon in the top right corner of the Copilot window, with the text 'Select '...' to view available actions'. The main Intune dashboard shows the 'Devices | Overview' section, including a sidebar with navigation options like Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main content area displays 'Manage devices by platform' with counts for Windows (76), iOS/iPadOS (4), macOS (10), Android (3), and Linux (8). It also shows 'Autopatch Groups Membership' with counts for Devices ready (29), Devices not ready (14), and Devices not registered (110). At the bottom, there's a section for 'Configuration policy assignment failures' with 11 profiles with error or conflict.

Explorer

Use Explorer to Gain Insight Across Your Devices, Policies, Apps and More

Explorer enables IT admins to ask questions in natural language about their Intune data, across devices, apps, policies and more, see and iterate on the results of those questions and meaningfully act to complete management tasks.

You can simply start typing your query into Explorer's query bar. Explorer will suggest queries from its query library that you can select from. Alternatively, you can browse examples of queries and select one to have it automatically populate in the query bar.

As an example, Explorer can be used to obtain a list of devices that have not applied quality updates over the past 3 months, then add the returned devices into a group which can be used as an assignment target for an expedited quality update policy.

Reference documentation: <https://go.microsoft.com/fwlink/?linkid=2317609>.

Alternate access
Explorer can be accessed at any time by selecting Explorer on the navigation menu, on the left-hand side of the Intune admin console. By default, it is pinned at the top. Admins can rearrange the order of the menu.
Additional suggested scenarios
Explorer has ready-made queries across app configuration, app protection, apps, compliance, device configuration, device updates and devices. Browse the query library and select any queries that resonates with you, or try some of the following (variables are noted in blue): • Get devices where encryption method type is Encryption Method and encryption is True False • Get Platform devices that are Ownership owned and are Compliance due to the compliance setting Compliance Setting Name ○ Try <i>deviceThreatProtectionRequiredSecurityLevel</i> for Compliance Setting Name to search for devices that have an elevated risk level

Steps	Screenshot
Navigate to Explorer by clicking on the Copilot Chat button and typing your question in natural language. To start, enter: “What devices have not patched for 3 months?”.	The screenshot displays the Microsoft Intune admin center. On the left is a navigation sidebar with links to Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main area features a large header 'Securely manage devices, access, and apps with Intune' and a 'Status' section with metrics: Devices not in compliance (48), Configuration policies with errors or conflict (11), Client app install failures (4), Connector errors (7), Service health (Unhealthy), and Account status (Active). On the right, the Copilot Chat interface is open, showing a 'What would you like to know?' prompt and a list of suggested queries. Annotations indicate the steps: 1. Click the Copilot button in the top right. 2. Type the question 'What devices have not patched for 3 months?' into the chat input. 3. Select a suggested query from the list.

Select **Get** devices that have not applied quality updates in **Number of Months** months.

Copilot Chat will recommend using Explorer to answer the question.

Select **Go to Explorer**.

Microsoft Copilot in Intune Scenario Guide (June 2026)

You will be taken automatically to Explorer, with the query already prefilled.

Select the blue text and type the number of months of missing quality updates that you want to search for.

The screenshot shows the Microsoft Intune admin center interface. On the left is a navigation pane with links to Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main area is titled 'Explorer' and contains a search bar with the query: 'Get devices that have not applied quality updates in Number Of Months months'. A red callout box with the text 'Text in blue are variables that can be changed to refine the query' points to the blue text 'Number Of Months' in the query. Below the search bar is a section titled 'Find the Intune data you're looking for' with a search icon. Below this is a 'Show examples for:' dropdown menu set to 'All categories'. There are four example cards: 'Apps' (Get Platform devices that have discovered app with name containing App Name installed), 'Compliance' (Get Platform devices that are Compliance state due to the compliance setting Compliance Setting Name), 'App Configuration' (Get users who have devices where the last check in with Intune is before Last Check In Date Time and), and 'Advanced Analytics' (Get devices that have high RAM usage with spike percentage greater than Ram Spike Percentage). On the right is a 'Copilot' sidebar with the heading 'What would you like to know?' and a text input area for questions. Below the input area is a 'Go to Explorer' button.

Explorer will search and return devices that meet the search criteria and provide a Copilot summary of the search and of the objects that were returned.

You could optionally return to the Explorer homepage by selecting the *Show examples* button to start a new query at any time.

Microsoft Copilot in Intune Scenario Guide (June 2026)

Type in the Explorer query bar to see suggested queries: *Get all non-compliant devices*.

The screenshot shows the Microsoft Intune admin center interface. On the left is a navigation pane with links to Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main area is titled 'Explorer' and contains a query bar with the text 'Get all non-compliant devices'. Below the query bar is a list of suggested queries: 'Get devices that are noncompliant due to not having any compliance policy assigned', 'Get devices that have Compliance set to "NONCOMPLIANT" or "ERROR"', 'Get noncompliant devices that are not within their compliance grace period', 'Get noncompliant devices that are still within their compliance grace period', and 'Get devices that are Compliant state'. A green callout box with an arrow points to the suggestions, containing the text: 'Explorer will suggest queries from its query library, based on what's entered into the query bar'. Below the suggestions is a message: 'Explorer might not know about your question yet. Submit your query to help us improve.' At the bottom, there are six example queries categorized by 'All categories': Apps, Compliance, App Configuration, Advanced Analytics, Device Updates, and Endpoint Privilege Management.

Microsoft Intune admin center

Copilot with Endpoint Privilege Management

Checking for Indicators of Compromise for Elevation Requests in Endpoint Privilege Management

Endpoint Privilege Management, a capability of Intune Suite, enables your end users to request admin elevation for tasks that require elevated privileges. Common tasks that require administrative privileges include application installations, updating device drivers and running certain Windows diagnostics. In this example, an end user has requested elevation to run a suspicious executable. Before granting this request, you want to ensure that there are no indicators of compromise associated with this executable.

Based off the response from Copilot, which analyzes data from Microsoft Defender Threat Intelligence, you can make an informed decision whether to allow the user's elevation request to run the executable or not, keeping your environment safe.

In this example, a user has requested the elevation of an oddly named executable. After querying Copilot for indicators of compromise, the elevation request was detected as a piece of malware and should not be approved for elevation.

Reference documentation:

- [Learn about using Endpoint Privilege Management with Microsoft Intune | Microsoft Learn](#)
- [Use Intune Suite add-on capabilities - Microsoft Intune | Microsoft Learn](#).

Steps

Navigate to **Endpoint Security > Endpoint Privilege Management** and select the **Elevation Requests** tab.

Click on any submitted executable name, under the file column.

Click on **Analyze with Copilot**.

Screenshot

The screenshot shows the Microsoft Intune admin center interface. On the left, the navigation pane has 'Endpoint security' selected, with a red arrow (1) pointing to it. The main area shows 'Endpoint security | Endpoint Privilege Management'. The 'Elevation requests' tab is selected, with a red arrow (3) pointing to it. Below the navigation pane, 'Endpoint Privilege Management' is selected, with a red arrow (2) pointing to it. A table of elevation requests is displayed, with 'Paypal.exe' highlighted in the 'File' column, and a red arrow (4) pointing to it. On the right, the 'Elevation request properties' pane is open, with a red arrow (5) pointing to the 'Analyze with Copilot' button.

Copilot Assisted Single Device Query

Natural Language to Kusto Query Language

Device query, a capability of Intune Suite, allows you to query a device in real time, obtaining information such as currently running processes, obtaining event log entries and more. Queries are written in the Kusto Query Language (KQL). Copilot can convert your queries from natural language into KQL straight from the Intune console, allowing you to quickly create complex queries and get the answer that you need faster.

In this example, Copilot will generate a KQL query that can be used to investigate a device that has been reported to have degraded performance and is now too slow for day-to-day tasks by querying the processes using the most memory. Finally, a remote action will be invoked to restart the device.

Device query can be used to query many other properties supported by the Intune Data Platform. The schema is documented below, and the additional suggested scenarios showcase some select use cases.

Reference documentation:

- [Device query in Microsoft Intune | Microsoft Learn](#)
- [Intune data platform schema | Microsoft Learn](#)
- [Use Intune Suite add-on capabilities - Microsoft Intune | Microsoft Learn.](#)

Additional suggested scenarios

Try asking Copilot to generate KQL queries for the following natural language questions:

- *Get a list of error events from the Microsoft-Windows-Windows Defender/Operational log for the last 21 days where the message contains malware and the level is warning*
 - Note: This query is used to find malware that has been detected as part of a scan of the device by Microsoft Defender. If no malware has been detected, then nothing will be returned by the query.
- *Query Microsoft 365 app configuration from the registry*
- *Show me the top 20 running processes on this device and exclude wmiprvse*
- *Show the last 5 app crash events on this device*

Steps

Navigate to **Devices > Windows**.

Screenshot

The screenshot displays the Microsoft Intune admin center interface. The left-hand navigation pane shows a list of services, with 'Devices' highlighted by a red arrow and the number 1. Within the 'Devices' section, the 'By platform' sub-menu is expanded, and 'Windows' is highlighted by a second red arrow and the number 2. The main content area, titled 'Devices | Overview', provides a summary of managed devices. It includes a 'Manage devices by platform' section with tiles for Windows (77 devices), iOS/iPadOS (4 devices), macOS (10 devices), Android (3 devices), and Linux (8 devices). Below this, several status reports are shown: 'Autopatch Groups Membership' (30 ready, 14 not ready, 114 not registered), 'Configuration policy assignment failures' (11 failures), 'Noncompliant devices' (45 noncompliant, 44 not evaluated, 0 missing policy), 'Deployment status per Windows update ring' (2 with error, 3 with conflict), 'Cloud PC performance' (0 issues), and 'Connected Frontline Cloud PCs' (0 reaching limit, 0 approaching limit).

Select a device that is currently online and select **Device query**.

Microsoft Copilot in Intune Scenario Guide (June 2026)

In the Copilot query textbox, enter: *What are the top 10 processes using the most memory on this device?*

The screenshot displays the Microsoft Intune admin center interface. The left-hand navigation pane includes links to Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The central pane shows the 'CPC-daha8-XLOO8 | Device query' page, which includes a search bar and a list of properties such as BiosInfo, Certificate, Cpu, DiskDrive, EncryptableVolume, FileInfo, LocalGroup, LocalUserAccount, LogicalDrive, MemoryInfo, OsVersion, Process, SystemEnclosure, and SystemInfo. On the right side, the Copilot interface is open, featuring a query input field with the text 'What are the top 10 processes using the most memory on this device?' highlighted by a red rectangle. Below the input field are 'Run' and 'Cancel' buttons, and a 'Generating query' status indicator. The bottom section of the Copilot interface contains 'Get started', 'Prerequisites', and 'Kusto database' sections with associated links.

Review the generated KQL and select **Run** to execute the query.

Copilot Assisted Device Query for Multiple Devices

Natural Language to Kusto Query Language

Device Query for Multiple Devices, a capability of Intune Suite, allows Intune administrators to run queries across multiple devices to gain comprehensive insights about the entire fleet of devices. Just like Device Query, Device Query for Multiple Devices uses Kusto Query Language (KQL) to query inventory data.

Copilot can convert your queries from natural language into KQL straight from the Intune console, allowing you to quickly create complex queries and get the answer that you need faster.

In this example, you are auditing your devices to find any that has an unencrypted volume, which goes against your organization's security standards.

Note: Device Query for Multiple Devices is only able to query devices that are already collecting device inventory data via an assigned Properties Catalog profile: [Properties catalog in Microsoft Intune | Microsoft Learn](#).

Device query for multiple devices can be used to query many other properties supported by the Intune Data Platform. The schema is documented below, and the additional suggested scenarios showcase some select use cases.

Reference documentation:

- [Device query for multiple devices in Microsoft Intune | Microsoft Learn](#)
- [Intune data platform schema | Microsoft Learn](#)
- [Use Intune Suite add-on capabilities - Microsoft Intune | Microsoft Learn](#).

Additional suggested scenarios

Try ask Copilot to generate KQL queries for the following natural language questions:

- *Show the top 5 CPUs sorted by core count*
- *Show all devices that have a battery cycle count greater than 1*
- *Show me devices that have at least 8 GB of RAM and more than 50 GB of storage and at least 1 volume encrypted*
- *Get info on SIM cards that are managed by mdm*

Steps	Screenshot
Select Devices, then select Device Query.	 The screenshot displays the Microsoft Intune admin center interface. On the left, the 'Devices' option is highlighted in the navigation pane, indicated by a red arrow and the number 1. In the center pane, the 'Device query' option is selected, also indicated by a red arrow and the number 2. The right pane shows the 'Device query' page, which includes a search bar, a list of properties (e.g., AppleAutoSetupAdmin..., AppleDeviceStates, AppleUpdateSettings, Battery, BiosInfo, Bluetooth, Cellular, Cpu, Device, DeviceStorage, DiskDrive, EncryptableVolume, LogicalDrive), and a section for generating queries. A red box highlights the input field labeled 'Enter a request to generate a query' in the 'Get started' tab. Below this, the 'Prerequisites' section explains that device properties are queried on demand and that a license including Microsoft Intune Advanced Analytics is required. The 'Kusto database' section provides links to learn more about Kusto query language, entities, and operators.

In the Copilot query textbox, enter: *Show all devices that have an unencrypted volume* and press enter.

The screenshot displays the Microsoft Intune admin center interface. On the left, a sidebar lists navigation options: Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main area is titled 'Devices | Device query'. It features a search bar and a list of properties: AppleAutoSetupAdmin..., AppleDeviceStates, AppleUpdateSettings, Battery, BiosInfo, Bluetooth, Cellular, Cpu, Device, DeviceStorage, DiskDrive, EncryptableVolume, and LogicalDrive. A red arrow points to the Copilot query input field, which contains the text 'Show all devices that have an unencrypted volume'. Below the input field, there is a 'Run' button and a 'Cancel' button. The status 'Generating query' is displayed. The right pane shows 'Get started' and 'Results' tabs, with 'Get started' selected. It includes a 'Prerequisites' section and a 'Kusto database' section with links for learning more about Kusto query language, entities, and operators.

Review the generated KQL query and select **Run** to execute the query.

The screenshot displays the Microsoft Intune admin center interface. On the left, a navigation pane lists various services, with 'Device query' selected. The main content area is titled 'Devices | Device query' and includes a search bar and a list of properties. A red arrow points to the 'Run' button in the 'Properties' section. The 'Run' button is located next to a text input field containing the query: 'Show all devices that have an unencrypted v'. Below the 'Run' button, a code editor displays the generated KQL query:

```
1 // Generated by Copilot. AI-generated content may be incorrect.
2 // Your request: Show all devices that have an unencrypted volume
3 // KQL Description: This query uses the EncryptableVolume table to find all vo
4 EncryptableVolume
5 | where EncryptionPercentage == 0
6 | project Device.DeviceId, WindowsDriveLetter, VolumeId
```

Below the code editor, there are sections for 'Get started', 'Prerequisites', and 'Kusto database'. The 'Prerequisites' section states: 'Query device properties on demand, based on device, app, and management properties. Query using the properties provided, write custom Kusto Query Language (KQL), or query with Copilot using natural language. [Learn more about Device query](#)'. The 'Kusto database' section includes links for 'Learn about the Kusto query language', 'Learn more about entities you can query', and 'Learn common operators for Kusto Query Language'.

Device query for multiple devices will return the results of the query.

Copilot Assisted Policy Management

Copilot in Intune is readily available when you are creating or managing policies and settings to configure devices. By selecting the "Summarize with Copilot" button, admins get a clear summary of policies and settings. Further conversation to understand the impact of the policies helps describe how policies affect users and security.

IT admins can also investigate specific settings, check for conflicts across policies, and ensure everything aligns with organizational needs - all without manual research.

Conflict resolution for policies targeting the same set of devices is critical to ensure that the intended setting is configured correctly. When organizations have many policies and potentially complex targeting queries to meet their business objectives, keeping track of conflicts can be a time-consuming exercise. Copilot can quickly identify if a setting has been across multiple policies, helping IT admins resolve conflicts.

Before deploying a new policy to devices or users, or changing an existing one, organizations need to be sure of the impact that it could have on their users and the security of their devices. IT admins may need to provide this information when submitting change control documentation. Copilot can identify impacts on both users (such as if the setting will invoke a reboot) and security (such as if a setting will reduce a device's attack surface) when configuring settings, reducing the time to research settings before deployment.

Copilot can recommend values for settings based on how Microsoft recommends the setting should be configured, or the implications for configuring the setting in a specific way.

Reference documentation: [Microsoft Copilot in Intune features overview](#) | [Microsoft Learn](#).

Additional suggested scenarios

Copilot can help with most settings in the Intune admin console:

- Look for the Copilot button next to configuration settings in any existing policy or when creating a new policy. Select it to ask Copilot for additional information about the setting.

Allow Toasts ⓘ ⓘ Allow

Setting Information and Conflict Assessment

In this example, you have been asked to ensure that macOS devices meet a base level of security before they are able to access corporate resources. To do this, you need to create a new macOS compliance policy, but you are unsure which settings to configure or if another admin has already implemented this setting in another policy.

Copilot will be used to:

1. Learn about settings to understand what they configure on the device and if they meet your objectives,
2. Ensure that there are no conflicts with existing policies, and,
3. Determine the recommended values for the various settings.

Steps

Select
Devices >
Compliance >
Create policy

Select macOS

Tell me about Intune setting "Stealth Mode"

Copilot

The "Stealth Mode" setting on macOS, when enabled, prevents the computer from responding to probing network requests, enhancing security by making the device less visible to unauthorized scans. However, the computer will still respond to incoming requests for authorized applications. This setting is not required by default in Intune compliance policies for macOS. No additional Microsoft documentation specific to macOS Stealth Mode was found in the provided documents.

Tell me about Intune setting "Stealth Mode"

Copilot

AI-generated content may be incorrect. Check it for accuracy.

The Intune setting "Stealth Mode" for macOS is designed to enhance device security by preventing the computer from responding to probing network requests. When stealth mode is enabled, the device will not reply to unsolicited network traffic, making it less visible to potential attackers. However, the computer will still respond to incoming requests for authorized applications. This setting is not required by default in macOS compliance policies ⁽¹⁾. No additional relevant technical details or best practices for macOS were found in the provided documentation.

Recommended value assessment

Summarization and Security Impact Assessment

In this example, imagine you are a new IT admin in your organization, and you are attempting to quickly come up to speed with the configuration policies that already exist within the Intune tenant. Since there are potentially many policies, you want to be able to quickly summarize the settings contained within each policy and determine what its impact on users and security are.

Select any of your existing device configuration policies to perform these demonstrations on.

Copilot will be used to:

1. Summarize a policy, providing information on all settings configured within the policy plus identifying the most important settings and providing info on its assignment status, and,
2. Determining the impact on users if they have the policy assigned to them, such as if a reboot will be required, and,
3. Determining risk analysis and summarizing the impact on security when the policy is applied, such as if configuring a setting will reduce the overall attack surface.

Steps

Select **Devices > Configuration** and select any of your existing device configuration policies.

Copilot

AI-generated content may be incorrect. Check it for accuracy.

The policy "WG default security policy" configures a range of device security and user experience settings for Windows 10 devices. Here's a summary of the key settings and their current values:

1. Allow Cortana Above Lock: Set to "Allow". This enables users to interact with Cortana using speech while the device is locked, differing from the most restrictive option which would require unlocking the device.

2. Allow Toasts: Set to "Allow". Toast notifications are permitted above the lock screen, as opposed to blocking them.

3. Allow Adding Non Microsoft Accounts Manually: Set to "Allow". Users can add non-Microsoft email accounts through the UI, which is less restrictive than blocking this capability.

4. Disable the Display Control Panel (User): Set to "Disabled". Users can access the Display Control Panel, which is the default behavior.

5. Hide Settings tab (User): Set to "Disabled". The Settings tab in Display Control Panel is visible, matching the default.

6. Enforce drive encryption type on operating system drives: Set to "Enabled" with "Used Space Only encryption". BitLocker will encrypt only the used space on OS drives, streamlining encryption compared to full drive encryption.

7. Control use of BitLocker on removable drives: Set to "Enabled". Users can apply BitLocker protection, suspend, and decrypt on removable drives, and choose the encryption type.

8. Deny write access to removable drives not protected by BitLocker: Set to "Enabled" and "Do not allow write access to devices configured in another organization" is "True". This restricts write access to only BitLocker-protected removable drives, enhancing data security.

9. [Deprecated] Disable Internet Explorer 11 as a standalone browser (User): Set to "Enabled". Prevents launching IE11 as a standalone browser, redirecting to Microsoft Edge.

10. Allow Camera: Set to "Not allowed". The camera is disabled, which is more restrictive than the default.

11. Allow Bluetooth: Set to "Disallow Bluetooth". Bluetooth is

Copilot

removable data drives (True): Provides flexibility for maintenance.

- Disable Internet Explorer 11 as a standalone browser (Enabled): Reduces attack surface by enforcing modern browser use.
- Allow Camera (Not allowed): Enhances privacy and security by disabling the camera.
- Allow Bluetooth (Disallow Bluetooth): Reduces risk of wireless attacks.
- Allow Cellular Data (Do not allow): Prevents use of cellular data, which can help control data exfiltration.
- Allow Cloud Protection (Allowed): Ensures Defender can leverage cloud intelligence for threat protection.

These settings are highlighted due to their direct impact on device security, data protection, and user privacy. The policy contains additional settings beyond those listed here.

Assignment Scope Summary:
The policy is assigned to the "Joba-CPC" group, which includes 1 device and no users, and to the "default workstations" group, which currently has no users or devices. The "Project Alpha team" group is explicitly excluded from this policy.

1. Policy Settings and Their Impact

This policy configures a comprehensive set of security and user experience controls for Windows 10 devices. Here's a breakdown of the most relevant settings, their current values, and how they differ from defaults:

1. Allow Cortana Above Lock: Set to "Allow". Users can interact with Cortana via speech while the device is locked, which is less restrictive than blocking this feature.

2. Allow Toasts: Set to "Allow". Toast notifications are permitted above the lock screen, matching the default.

3. Allow Adding Non Microsoft Accounts Manually: Set to "Allow". Users can add non-Microsoft email accounts through the UI, which is less restrictive than blocking this capability.

4. Disable the Display Control Panel (User): Set to "Disabled". Users can access the Display Control Panel, which is the default.

5. Hide Settings tab (User): Set to "Disabled". The Settings tab in Display Control Panel is visible, matching the default.

6. Enforce drive encryption type on operating system drives: Set to "Enabled" with "Used Space Only encryption". BitLocker will encrypt only the used space on OS drives, streamlining encryption compared to full drive encryption.

7. Control use of BitLocker on removable drives: Set to "Enabled". Users can apply BitLocker protection, suspend, and decrypt on removable drives, and choose the encryption type.

Copilot

cloud protection and real-time monitoring boosts threat detection but could marginally impact system performance. Not checking for updated signatures before scans may leave devices briefly exposed to new threats. Overall, the policy prioritizes security and compliance, with some trade-offs in user flexibility and convenience.

4. Policy Conflicts

Potential conflicts exist if other policies with overlapping settings are assigned to the same groups. For example:

- The "Endpoint Management Summit 2024" policy, assigned to "default workstations", configures settings such as "Allow Camera" (Not allowed), "Allow Cortana Above Lock" (Allow), and "Allow Cloud Protection" (Allowed). Since "WG default security policy" is also assigned to this group, these settings could conflict if their values differ.
 - Policy Link
- The "Microsoft Defender for Endpoint Security Baseline" policy, assigned to "MDE Security Baseline - Pilot", configures several overlapping security settings, but since the assignment group does not overlap with "Joba-CPC" or "default workstations", there is no direct conflict.

You should review the linked policies to ensure that settings do not

Policy Name: WG default security policy

Security Impact Analysis

The "WG default security policy" is designed to significantly strengthen device security for Windows 10 environments by enforcing a robust set of controls. Key security-focused settings include:

1. BitLocker Enforcement: The policy mandates drive encryption for both operating system and removable drives. Operating system drives use "Used Space Only" encryption, while users can choose the encryption type for removable drives. This ensures that data at rest is protected, reducing the risk of data loss from device theft or unauthorized access.

2. Removable Media Controls: Write access to removable drives is denied unless the drive is protected by BitLocker and configured within the organization. This prevents data exfiltration via unencrypted USB devices and enforces organizational data handling standards.

3. Malware Protection: Windows Defender features are enabled, including real-time monitoring, archive scanning, and cloud protection. These settings ensure continuous threat detection and leverage cloud intelligence to identify emerging threats. However, the policy does not require checking for updated signatures before scans, which could leave a brief window of exposure to new malware.

4. Peripheral and Connectivity Restrictions: The camera and Bluetooth are disabled, reducing the attack surface for device exploitation and data leakage. Cellular data and roaming are

Copilot Assisted Troubleshooting

Copilot in Intune can assist IT admins with resolving device issues by centralizing information commonly used when troubleshooting issues.

With Copilot in Intune, you can:

- Get more information about a specific device, including installed apps, group membership, and more.
- Compare devices to see the similarities and differences between them, like the compliance policies, hardware, and device configurations assigned to both devices.
- Use the error analyzer prompt to get more information about a specific error code in Intune, and get a possible resolution.

Reference documentation: [Copilot in Intune shows device information and errors | Microsoft Learn](#).

Device Summarization and Comparison

Copilot can be used to quickly understand the differences and similarities between two devices, across configuration, apps, group memberships and more.

In this example, select two devices in your organization and use Copilot to first provide a summary of one of the devices. This will provide an overview of all the information Intune knows about the device, such as assignment status of policies, compliance state, group membership and more. Then, compare the two devices to quickly identify the differences between them.

Steps	Screenshot
Open Copilot Chat and type <i>summarize device</i> . Select Summarize an Intune device .	 The screenshot displays the Microsoft Intune admin center interface. On the left is a navigation pane with categories like Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main area shows the 'Devices Overview' page, which includes a search bar, a 'Refresh' button, and links for 'View tour' and 'Provide feedback'. The 'Manage devices by platform' section lists device counts for Windows (77), iOS/iPadOS (4), macOS (10), Android (3), and Linux (8). Below this is the 'Autopatch Groups Membership' section with counts for 'Devices ready' (30), 'Devices not ready' (14), and 'Devices not registered' (114). The 'Configuration policy assignment failures' section shows 'Profiles with error or conflict' (11). On the right, the Copilot chat interface is open, displaying prompts like 'What would you like to know?' and a list of suggestions. A red arrow labeled '1' points to the 'summarize device' suggestion in the list, and another red arrow labeled '2' points to the 'Summarize an Intune device' option at the top of the suggestions list.

Enter the name of a device that you want to summarize.

Review the summary of the device, which provides details on group members, compliance status and hardware info.

Microsoft Copilot in Intune Scenario Guide (June 2026)

In Copilot Chat, enter compare devices and select Compare two Intune devices.

The screenshot shows the Microsoft Intune admin center interface. The left sidebar contains navigation links: Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main content area is titled 'Devices | Overview' and includes a search bar, refresh button, and links for 'View tour' and 'Provide feedback'. The 'Manage devices by platform' section displays device counts for Windows (77), iOS/iPadOS (4), macOS (10), Android (3), and Linux (8). Below this, the 'Autopatch Groups Membership' section shows counts for 'Devices ready' (30), 'Devices not ready' (14), and 'Devices not registered' (114). The 'Configuration policy assignment failures' section shows 'Profiles with error or conflict' (11). The Copilot chat interface is open on the right, displaying a 'Last Sync' timestamp of 2025-10-20T02:03:03, 'Noncompliance Reasons' (None reported), and a list of device group memberships. The 'Suggestions' section lists several prompts, including 'Compare two Intune devices' (highlighted with a red arrow labeled 2) and 'compare devices' (highlighted with a red arrow labeled 1). The 'compare devices' suggestion is also present in the input field at the bottom of the chat.

The device CPC-kago2-JSD0H has a total of 3 distinct device configuration policies, generating 3 status reports. The device CPC-mais1-HZ4XL has 21 distinct device configuration policies, generating 37 status reports. This difference is due to some policies being assigned to multiple users, resulting in multiple status reports for a single policy.

The device CPC-kago2-JSD0H has 0 different configuration policies.

The device CPC-mais1-HZ4XL has 18 different configuration policies.

Only the differences or uniqueness of each property are evaluated for the most recent policies.

Microsoft Copilot in Intune Scenario Guide (June 2026)

Additional suggested scenarios

Ask Copilot to analyze the following error codes:

- 0x87D136B8
- 0x87D136B7
- 0x87D136B6
- 0x87D136B5
- 0x87D136B4
- 0x87D136B3
- 0x87D136B2

Steps	Screenshot
Open Copilot Chat and in the prompt, type: Analyze error code . In the suggested prompts, select Analyze an error code .	

In the error code box, enter the error code **0x87D136B9**.

The screenshot displays the Microsoft Intune admin center interface. On the left is a navigation pane with categories like Home, Dashboard, All services, Explorer, Devices, Apps, Endpoint security, Reports, Users, Groups, Tenant administration, and Troubleshooting + support. The main area is titled 'Devices | Overview' and includes a search bar, a refresh button, and links for 'View tour' and 'Provide feedback'. Below this is a 'Manage devices by platform' section with cards for Windows (77 devices), iOS/iPadOS (4 devices), macOS (10 devices), Android (3 devices), and Linux (8 devices). A red circle with the number '1' is placed over the Android card. Below the platform cards is a 'Copilot error code analysis' box. To the right of the main content is a Copilot sidebar. It contains a prompt 'What would you like to know?' with a button 'Analyze an error code'. Below this is a text input field containing '0x87D136B9' and a 'Submit' button. The Copilot response, enclosed in a blue box, states: 'The error code 0x87D136B9 corresponds to "4009 locked" in Microsoft Intune for iOS/iPadOS devices. This indicates that the device is locked, which can prevent certain management actions or configurations from being applied successfully 1.' At the bottom of the Copilot sidebar is a text input field with the placeholder 'Type your question to get prompts to choose from' and a right arrow button.
